Three experts’ views on four proposals

Singaporeans take an average of 60g of sugar a day, which is higher than advisable.

The World Health Organisation (WHO) says 50g of sugar is the maximum amount the body can handle daily, ideally, sugar consumption should be no more than 25g a day.

The WHO guideline does not refer to the sugars in fresh fruit and vegetables, and sugars naturally present in milk, because there is no reported evidence of adverse effects of consuming these.

The Ministry of Health has proposed four measures to try to reduce the consumption of pre-packaged sugar-sweetened beverages (SSB) here.

Professor Teo Yik Ying, dean of the NUS School of Public Health; Dr Jeremy Lim, consultant at global consulting firm Oliver Wyman; and Straits Times senior health correspondent Salma Khaliq give their views on the proposals.

**BAN HIGH-SUGAR DRINKS:**

Teo Yik Ying: Infringements on personal liberty and freedom of choice.

Jeremy Lim: Not in favour.

Salma Khaliq: There are too many extremely high-sugar drinks that are not pre-packaged, and so do not fall under this proposal. It is thus of limited use. Having said that, SSBS are cheaper and more easy to obtain, so getting them off the shelves might be helpful.

But the final decision hinges on what is considered really high sugar content. It is fine to have a ban if only a small number of drinks are involved, but not if it means clearing the shelves of a number of favourites.

**IMPOSE TAX ON HIGH-SUGAR DRINKS:**

Teo Yik Ying: Provides a strong incentive for industry to reformulate and innovate. Clear signal to the public on the downsides of consuming beverages high in sugar. Also generates revenue that can be channelled towards bringing down costs of healthy products.

But unless the tax is applied across a wide array of sugar-bomb products, singling out only SSBS may lead to substitution effects where consumers obtain their sugar fix from other food products.

Jeremy Lim: Graded taxes based on sugar content make sense, much like progressive income tax models.

Salma Khaliq: Very, very, and taxation only on pre-packaged drinks, while ignoring the freshly prepared drinks in coffee shops, cafes and so on would just produce an unfair commercial playing-field.

The bigger benefit of taxation might be signalling instead of disap-provial and reducing manufacturer reformulation, much like what has happened in the United Kingdom.

SK: In favour. It is likely to get manufacturers to reduce the sugar content to avoid paying the tax. If this is done gradually, few people would notice the reduction in sugar. I, for one, would appreciate being able to have an SSBS without feeling guilty about the amount of sugar consumed.

**BAN ADVERTISEMENTS OF HIGH-SUGAR DRINKS:**

Teo Yik Ying: Advertisements do influence the choices of children, and exposure to these food products high in fat, sugar and salt negatively shapes their food preferences. A well-implemented ban on SSBS reduces exposure, and minimizes influence from advertisements.

It needs to be properly enforced and extended to all media, including social and online media.

Jeremy Lim: The young are the most digitally savvy, and digital marketing is typically borderless, or at least difficult to police based on national jurisdictions. Traditional media like print, television and radio can be more effectively policed.

Salma Khaliq: Difficult to enforce with the proliferation of social media, but a good idea if it can be done given the strong influence of advertisements on buying behaviour, but would not be worth it if ban is enforced only on some platforms.

**HAVE COMPELLING FRONT-OFFACE NUTRITION LABEL:**

Teo Yik Ying: Good if it’s a clear infographic that lets consumers do a quick evaluation. Just say “overweight due to the main focus on energy-yielding nutrients, namely sugar.”

Salma Khaliq: Can be confusing if traffic-light labels are used on the same product for different categories such as for calories, fat and sugar.

Jeremy Lim: Good in theory, but the secret is in designing the label and informing consumers in ways that are fair, accurate and still appealing to consumers.

Consumers have to drink something, so the nominal calculus is about alternatives and easy ways to compare one sugary drink against another.

There is some controversy over whether the Healthier Choice Symbol has been and whether products with the symbol are actually healthier or less unhealthy. Again, it depends on what is being compared. If sugar is the standard, then everything else is bad.

SK: Support in principle, but has to be easy to understand, such as an overall rating of whether the food is good for health, neutral or bad for health.

The negative is that it might be too simplistic, or have too many falling into the neutral category, because it is low in one “bad” thing but high in another, such as low in sugar but high in salt and saturated fat. An alternative is to indicate for three or four categories of health concern.

This would make it more difficult for people to decide, but would provide more information. At the very least, it would make people more aware of what they are eating.
